LegalEase

7. Project Documentation Phase

AI-Powered Legal Document Generator

Objective

Document how LegalEase works, how users interact with it, and how the application is configured and executed.

Project Overview

LegalEase uses Generative AI to simplify legal document creation while providing editable previews, professional formatting, branding and multi-format export.

User Guide

- Enter the type of legal document.
- Enter the involved parties and their roles.
- Enter terms and conditions separated by semicolons.
- Enter the effective date.
- Click Generate Document.
- Review and edit the generated document.
- Download the result as TXT, DOCX or PDF.

Technical Documentation

- Backend: FastAPI with modular routes.
- Frontend: Streamlit.
- AI: Gemini 1.5 Pro as specified in the supplied project documentation.
- Document generation: python-docx and FPDF.
- Configuration: .env for the Gemini API key.
- Dependencies: captured in requirements.txt.

Document Output Documentation

- TXT provides plain-text output.
- DOCX provides editable Word output with logo and footer formatting.
- PDF provides a formatted, ready-to-use document with logo and footer.

Limitations / Source-Supported Notes

- The supplied documentation describes the architecture and workflow but does not provide complete implementation code for every module.
- The documentation contains both Gemini and a reference to 'Groq (Gemini) API Calls'; the overall architecture consistently identifies Gemini as the intended AI integration.
- LegalEase is presented as a document-generation and legal-information accessibility tool; generated legal documents should be reviewed for the user's specific legal requirements.

Conclusion

The documentation presents LegalEase as a scalable AI-assisted platform combining document generation, document formatting, user editing and multi-format export.
